

POSTMAN

Postman: Holistic API Design & Governance for Scale

Design with Speed. Govern with Confidence. Evolve with One Source of Truth.

Streamline your API workflows from design to delivery on a single, developer-friendly platform. Postman enables multi-protocol specification design, enforceable governance, and seamless synchronization across mocks, tests, docs, and runtime all without tool-switching.

Design APIs Right from Day One

Multi-format & Multi-protocol Support: Create and manage specifications in OpenAPI 3.0 and AsyncAPI 2.0 (e.g. REST, event-driven APIs) in a unified interface.

Visual + Code Editors: Choose visual outlines or JSON/YAML editing, autocomplete, snippets, live previews, and sidebar navigation make spec authoring intuitive.

Built-in Validation & Governance: Spectral-based linting catches syntax and compliance issues in real time, enforcing organizational API standards early.

Instant Collection Generation & Sync: One-click workflows convert specs into Postman Collections, which stay synchronized automatically updating tests, docs, and mocks when specs change.

Governance & CI/CD Integration That Scales

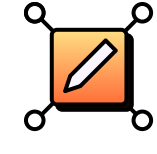

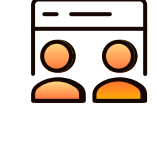

Automated Linting in CI/CD: Enforce style guides and validation rules either in the Postman app or as part of your pipeline, catching issues before deployment.

Role-Based Access & Version Control: Restrict spec editing by role; maintain version history and structured review workflows akin to Git.

Everything Evolves as One: From Spec to Runtime

-  **Spec-Driven Workflow:** Specs automatically power downstream tools tests, mocks, documentation so design changes ripple consistently across your API lifecycle.
-  **Collection Types for Schema Enforcement:** Define request and response types directly in Collections enabling schema validation, auto-completion, and stricter data correctness even if you didn't start with a spec.
-  **Unified Collaboration:** Teams access a single source of truth for API design no imports, exports, or version conflicts. Everything stays in sync across users.

Why Postman? One Unified Platform for API Scale

Developer Velocity	Governance & Compliance	Lifecycle Continuity
Multi-protocol spec editing	Spectral linting & style enforcement	Updates propagate to docs, tests, mocks
Visual + code workflows	CI/CD integration for design checks	Shared source-of-truth specs & collections
Visual + code workflows	CI/CD integration for design checks	Shared source-of-truth specs & collections

Trusted by over 500,000 companies, 40 million users, and 98% of the Fortune 500
